

IN THE CLAIMS

Please amend the following claims:

1. (Currently Amended) A method for reducing test data volume in the testing of logic products, comprising the steps of:

(a) generating original test vector data targeting a plurality of faults, said original test vector data including care bits and non-care bits;

(b) after generating said original test vector data, filling said non-care bits with a repeated value to form a compressible test vector data set; and

(c) compressing said compressible test vector data set to form a compressed test vector data set.

2. (Original) The method of claim 1, further comprising the steps of:
transmitting said compressed test vector data set to a test system; and
recovering the care bits of said original test vector data from said compressed vector data set, for loading into input latches of a tester in said test system.

3. (Original) The method of claim 1, wherein said step (b) comprises:
generating a background vector data set; and
forming a differential vector data set by XORing said care bits with corresponding bits in said background vector data set.

4. (Previously Presented) The method of claim 3, wherein said XORing sets more than a predetermined portion of said care bits to a value of 0 in said differential vector data set, wherein said predetermined portion of said care bits can exceed half of said care bits.

5. (Previously Presented) The method of claim 1, further comprising the step of attaching a header to said differential vector data set, said header identifying an algorithm and seed used to generate said background vector data set, wherein said differential vector data set attached with header forms said compressible test vector data set.

6. (Previously Presented) The method of claim 5, further comprising the step of decompressing said compressed test vector data set;
extracting said differential vector data set and attached header;
reconstructing said background vector data set from said header; and
XORing said reconstructed background vector data set with said extracted differential vector data set to form a reconstructed test vector data set.

7. (Original) The method of claim 6, wherein said reconstructed test vector data set comprises the care bits of the original test vector data, with the non-care bits having the values of the corresponding background vector data bits.

8. (Original) The method of claim 3, wherein said background vector data set comprises a random distribution of bits having values of both "0" and "1".

9. (Currently Amended) A method for reducing test data volume in the testing of logic products, comprising the steps of:

generating redundant test vectors from original test vector data, said original test vector data targeting a plurality of faults; and

after generating said redundant test vectors, utilizing a repeat capability of a tester to load input latches of the tester with the redundant vectors.

10. (Original) The method of claim 9, wherein said step of generating redundant test vectors comprises repeating a care bit value encountered in a first test vector of said original test vector data in non-care bits of neighboring test vectors.

11. (Original) The method of claim 10, wherein said original test vector data comprises a matrix of test vectors arranged in rows and columns, and said care bit value is repeated in the same column for each row of said matrix, until a different care bit value is encountered.

12. (Original) The method of claim 11, wherein when said different care bit value is encountered, said different care bit value is repeated in the same column for each row of said matrix, until another different care bit value is encountered.

13. (Currently Amended) A computer-usable medium storing computer-executable instructions, said computer-executable instructions when executed implementing a process for reducing test data volume in the testing of logic products, comprising the steps of:

- (a) in original test vector data initially comprising care bits and non-care bits where said original test vector data targets a plurality of faults, thereafter filling said non-care bits with a repeated value to form a compressible test vector data set; and
- (b) compressing said compressible test vector data set to form a compressed test vector data set.

14. (Previously Presented) The computer-usable medium of claim 13, said process further comprising:

transmitting said compressed test vector data set to a test system; and
recovering the care bits of said original test vector data from said compressed vector data set; for loading into input latches of a tester.

15. (Currently Amended) A program storage device readable by a machine, embodying a program of instructions executable by the machine to perform method steps for receiving original test vector data each targeting a plurality of faults and thereafter generating redundant test vectors from said original test vector data, ~~each of said original test vectors targeting a plurality of faults,~~ by repeating a care bit value encountered in a first test vector of said original test vector data in non-care bits of neighboring test vectors.

16. (Original) The program storage device of claim 15, wherein said original test vector data comprises a matrix of test vectors arranged in rows and columns, and said care bit value is repeated in the same column for each row of said matrix, until a different care bit value is encountered.

17. (Currently Amended) A method for reducing test data volume in the testing of logic products comprising:

(i) forming a compressed test data set by providing original test data targeting a plurality of faults and by subsequently setting care bits and non-care bits initially in said original test data to a repeated value and compressing said original test data, said original test data targeting a plurality of faults;

(ii) downloading said compressed test data set to a testing system for logic products;

(iii) decompressing said compressed test data set to form a decompressed test data set; and

(iv) loading input latches in a logic product with said decompressed data set.

18. (Previously Presented) The method of claim 17, wherein said step (i) comprises XORing said care bits with corresponding bits of a background vector data set.

19. (Original) The method of claim 18, wherein said background vector data set, has a random distribution of bits having values of 0 and 1.

20. (Previously Presented) The method of claim 19, wherein said XORing sets more than a predetermined portion of said care bits to a value of 0, wherein said predetermined portion of said care bits can exceed half of said care bits.

21-24. (Cancelled).
